0

Declined

0

Unresolved

0 Critical

Critical risks are those that impact the safe functioning of a platform and must be addressed before launch. Users should not invest in any project with outstanding critical risks.

2 Major

2 Mitigated

Major risks can include centralization issues and logical errors. Under specific circumstances, these major risks can lead to loss of funds and/or control of the project.

5 Medium

5 Resolved

Medium risks may not pose a direct risk to users' funds, but they can affect the overall functioning of a platform.

12 Minor

9 Resolved, 1 Partially Resolved, 2 Acknowledged

Minor risks can be any of the above, but on a smaller scale. They generally do not compromise the overall integrity of the project, but they may be less efficient than other solutions.

5 Informational

4 Resolved, 1 Partially Resolved

Informational errors are often recommendations to improve the style of the code or certain operations to fall within industry best practices. They usually do not affect the overall functioning of the code.

APPROACH & METHODS | DEFI FRANC

This report has been prepared for DeFi Franc to discover issues and vulnerabilities in the source code of the DeFi Franc project as well as any contract dependencies that were not part of an officially recognized library. A comprehensive examination has been performed, utilizing Manual Review and Static Analysis techniques.

The auditing process pays special attention to the following considerations:

- Testing the smart contracts against both common and uncommon attack vectors.
- Assessing the codebase to ensure compliance with current best practices and industry standards.
- Ensuring contract logic meets the specifications and intentions of the client.
- Cross referencing contract structure and implementation against similar smart contracts produced by industry leaders.
- Thorough line-by-line manual review of the entire codebase by industry experts.

The security assessment resulted in findings that ranged from **major** to **informational**. We recommend addressing these findings to ensure a high level of security standards and industry practices. We suggest the following recommendations that could better serve the project from the security perspective:

- Testing the smart contracts against both common and uncommon attack vectors;
- Enhance general coding practices for better structures of source codes;
- Add enough unit tests to cover the possible use cases;
- Provide more comments per each function for readability, especially contracts that are verified in public;
- Provide more transparency on privileged activities once the protocol is live.

REVIEW NOTES | DEFI FRANC

Overview

DeFi Franc is a liquidity mining aggregator that aggregates liquidity mining opportunities throughout the ecosystem.

The smart contracts in the scope of the audit were forked from Liquity and Vesta Finance, which are protocols for collateralized liquidity mining. It allows users to use the native token as collateral in order to borrow the CHF stablecoin DCHF, with zero percent interest. Furthermore, users can stake their stablecoin to earn the reward token Moneta or use the stablecoin to redeem the native token at face value, regardless of the price of the stablecoin.

External Dependencies

The scope of the audit treats third-party entities as black boxes and assumes their functional correctness. However, in the real world, third parties can be compromised and this may lead to lost or stolen assets.

There are a few dependent injection contracts or addresses in the current project:

- Chainlink oracle;
- Collateral assets.

Privileged Functions

In the `DeFi Franc` project, multiple privileged roles are adopted to ensure the dynamic runtime updates of the project, which were specified in the finding *GLOBAL-01 | Centralization Related Risks*.

The advantage of those privileged roles in the codebase is that the client reserves the ability to adjust the protocol according to the runtime required to best serve the community. It is also worth noting the potential drawbacks of these functions, which should be clearly stated through the client's action/plan. Additionally, if the private keys of the privileged accounts are compromised, it could lead to a devastating consequence to the project.

To improve the trustworthiness of the project, dynamic runtime updates in the project should be notified to the community. Any plan to invoke the aforementioned functions should be also considered to move to the execution queue of the `TimeLock` contract.

GLOBAL-01 | CENTRALIZATION RELATED RISKS

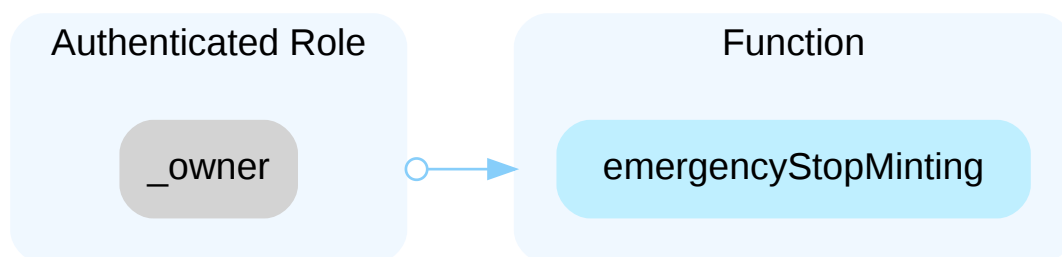

Category	Severity	Location	Status
Centralization / Privilege	● Major		● Mitigated

I Description

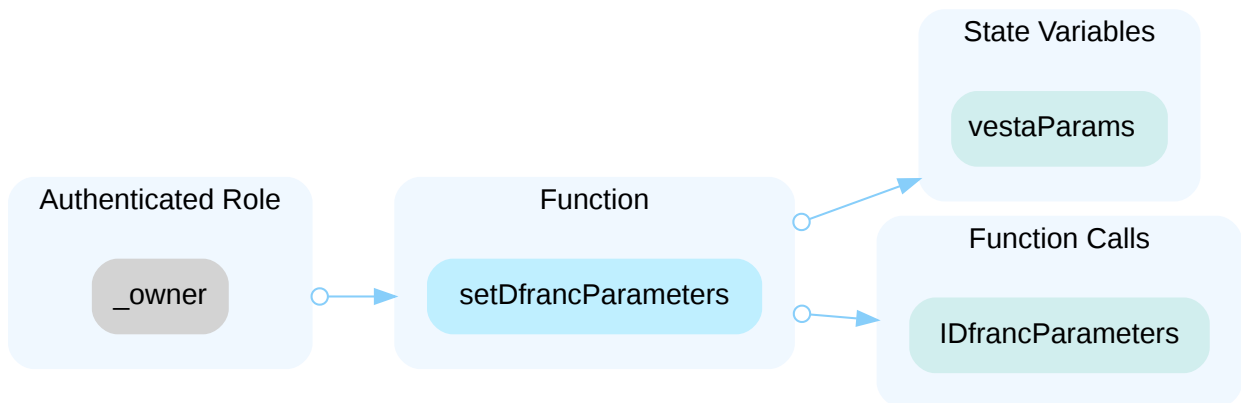

In the contract `AdminContract`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and add his own custom tokens as collateral.

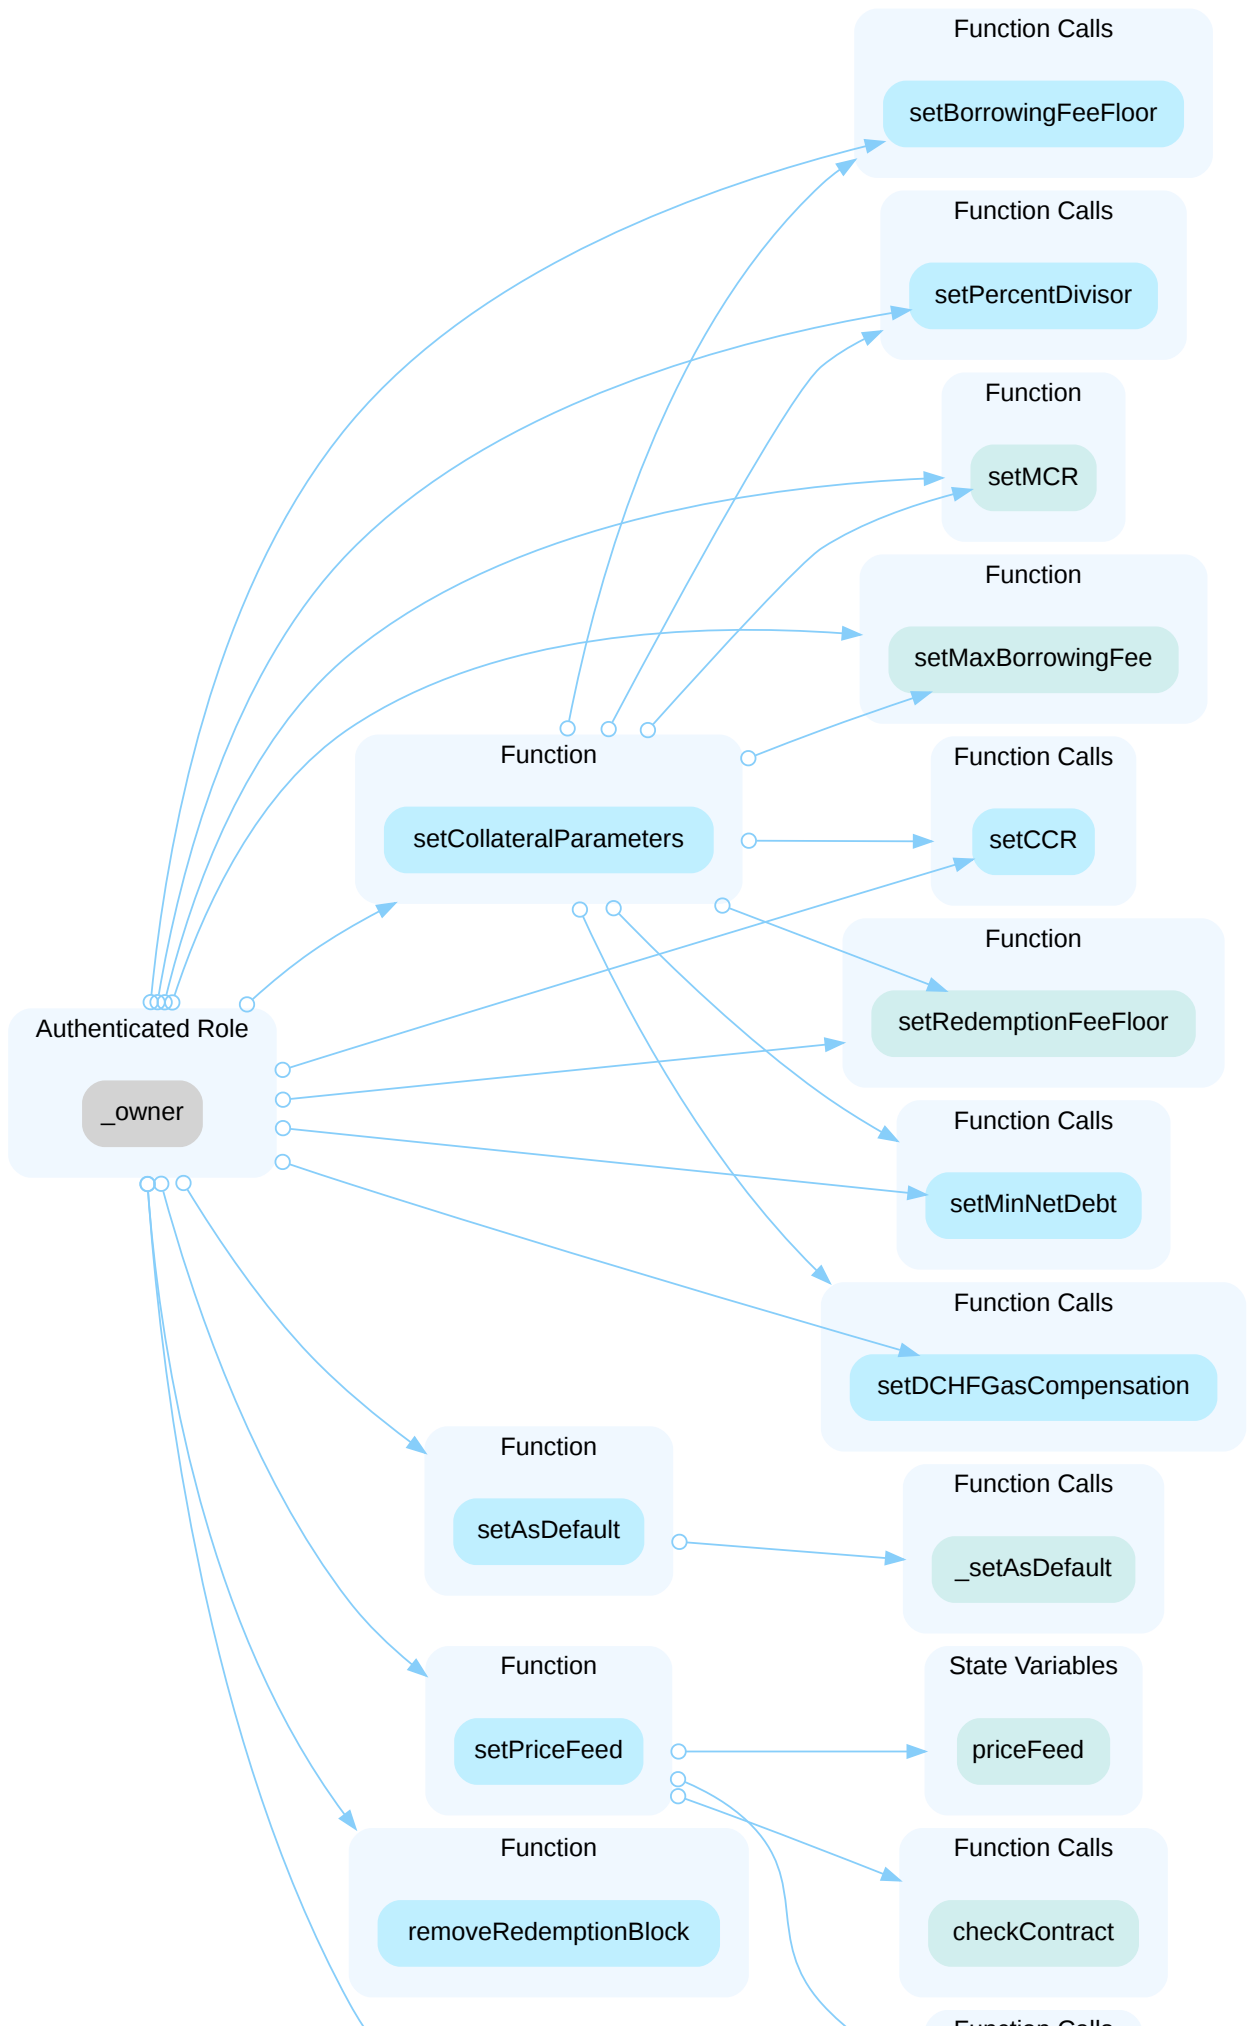

In the contract `DCHFToken`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and stop the minting of `DCHF`.

In the contract `DfrancBase`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and modify the address for protocol parameters.

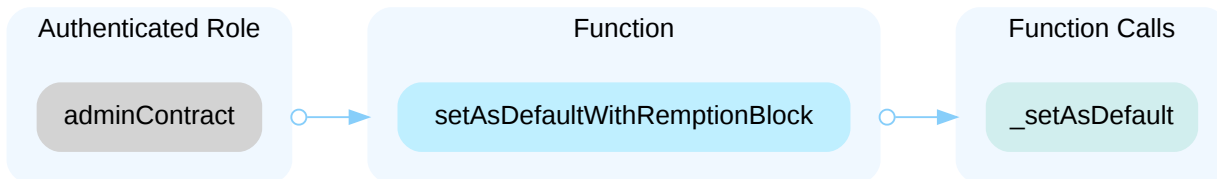

In the contract `DfrancParameters`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and modify the admin contract or change protocol parameters.

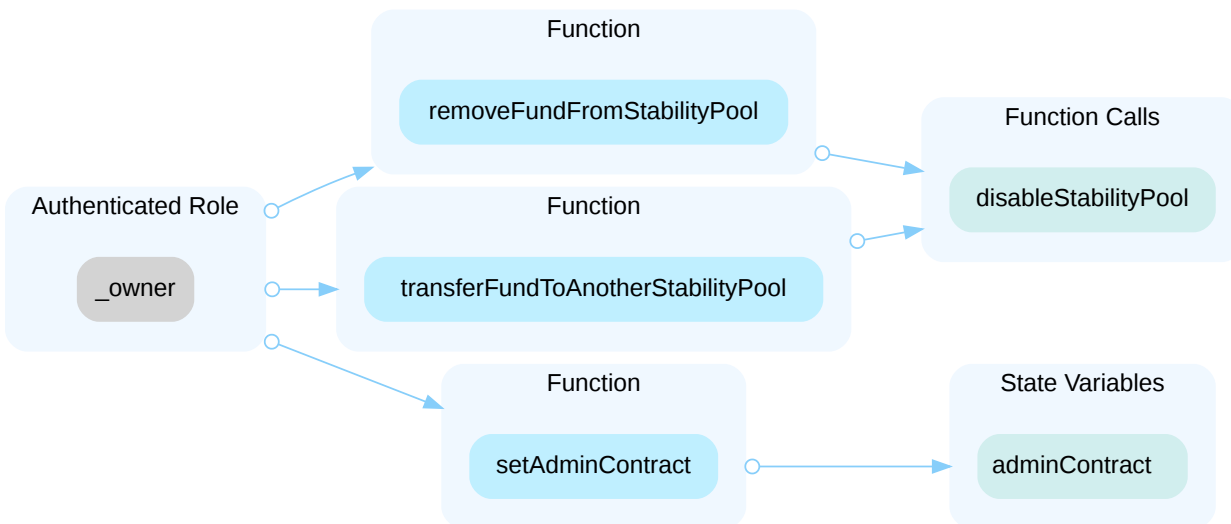

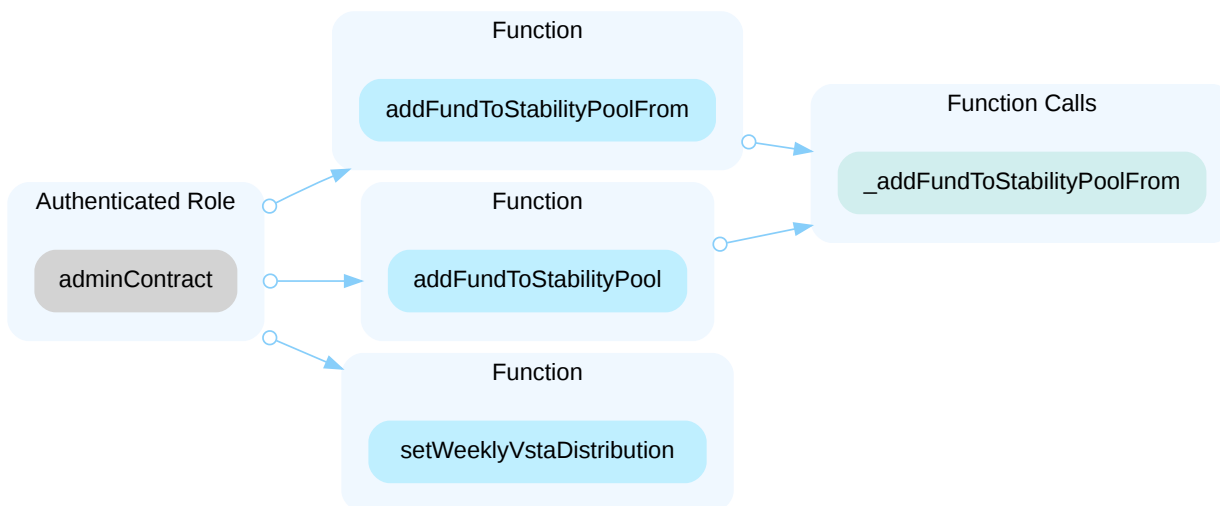

In the contract `DfrancParameters`, the role `adminContract` has authority over the functions shown in the diagram below. Any compromise to the `adminContract` account may allow the hacker to take advantage of this authority and configure some state variables for an asset.

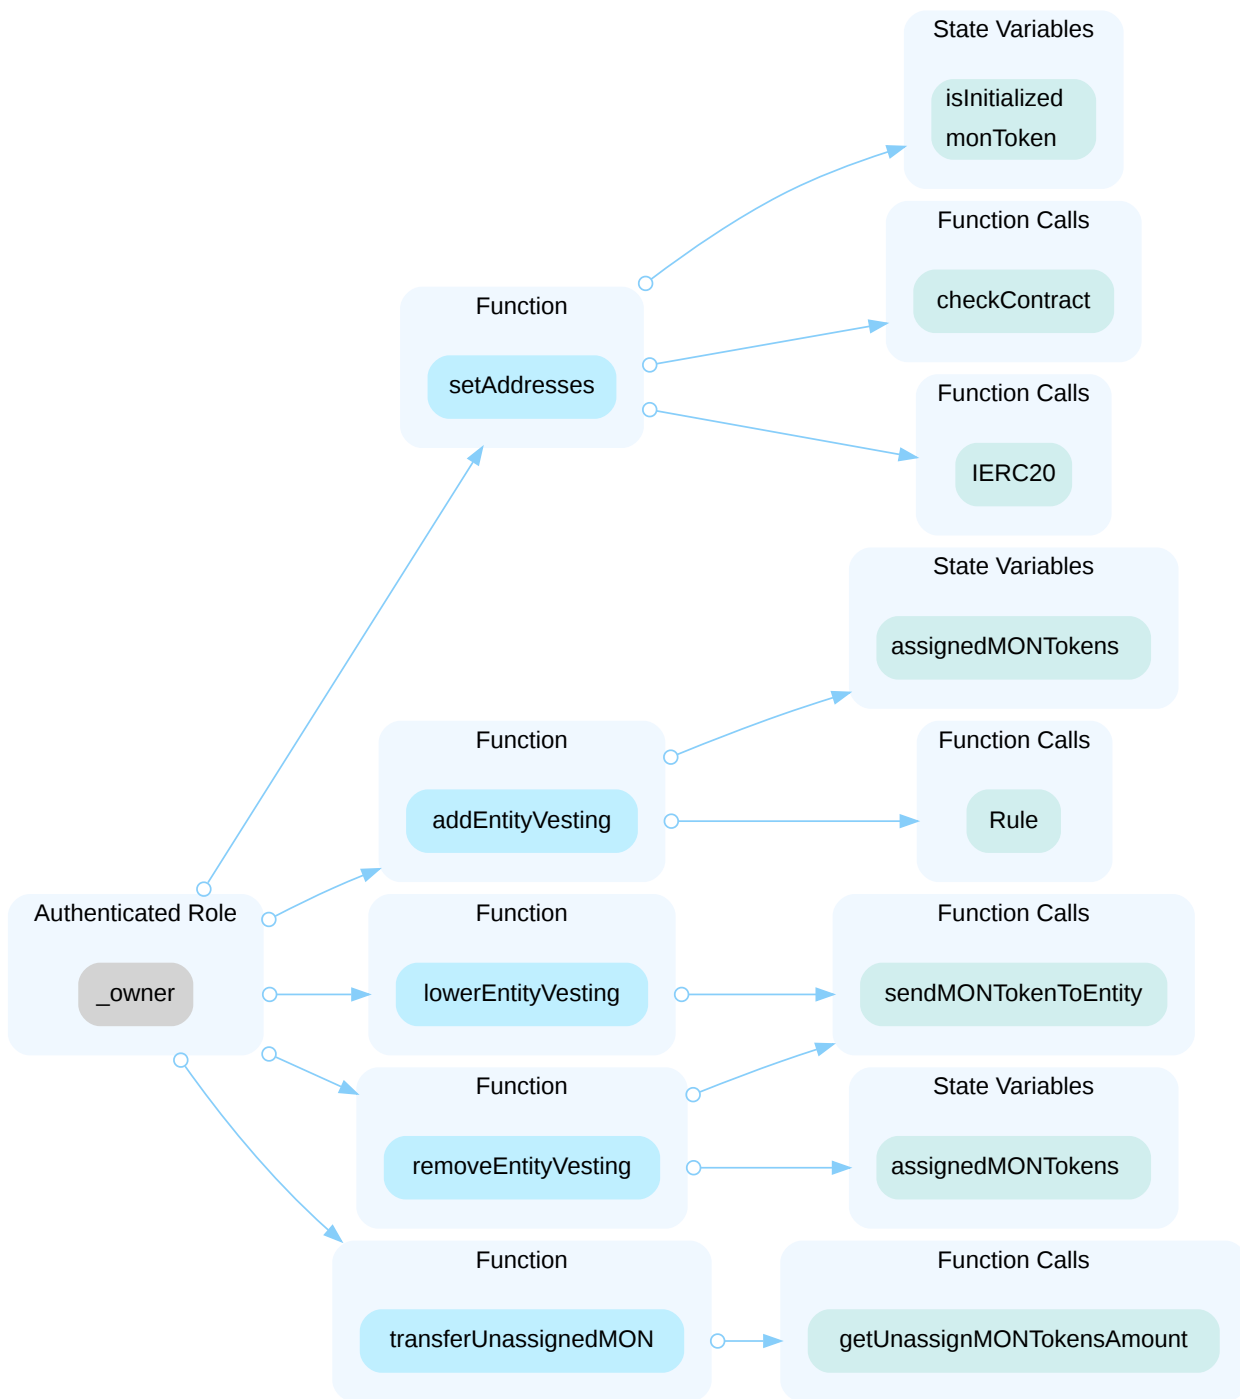

In the contract `CommunityIssuance`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and modify the admin contract.

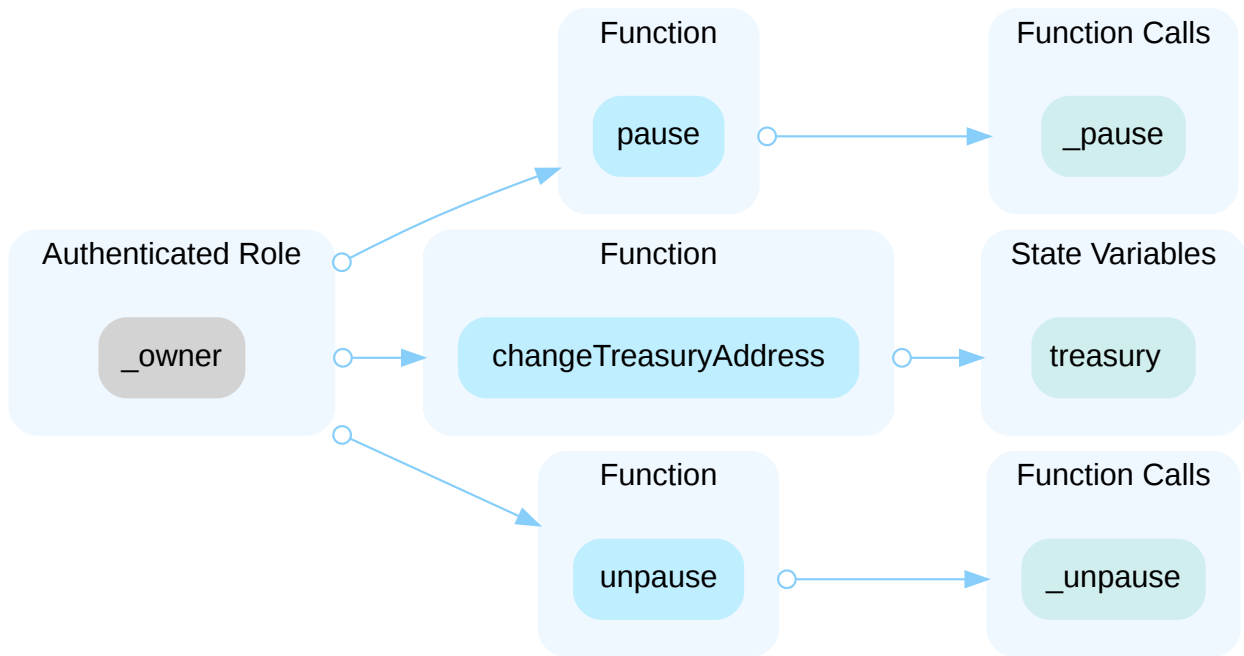

In the contract `CommunityIssuance`, the role `adminContract` has authority over the functions shown in the diagram below. Any compromise to the `adminContract` account may allow the hacker to take advantage of this authority and modify the weekly distribution of tokens.

In the contract `LockedMON`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and remove an entity from the `entitiesVesting` array.

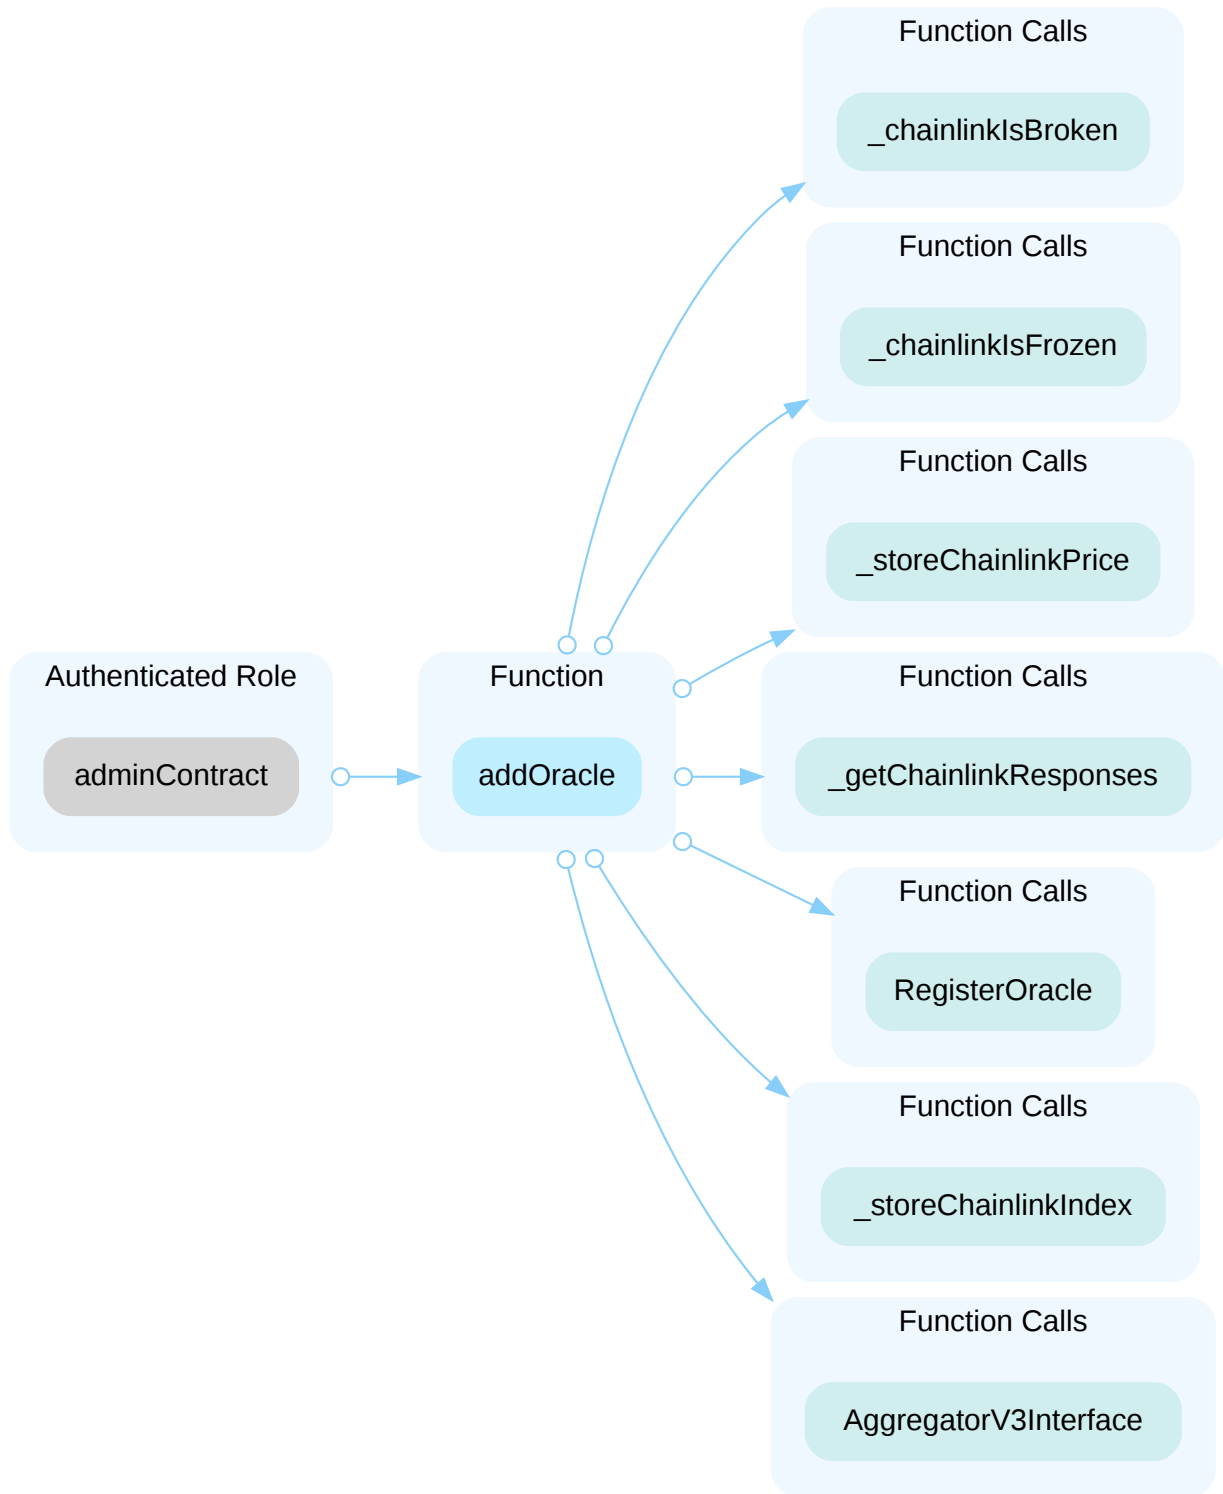

In the contract `MONStaking`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and pause the contract.

In the contract `PriceFeed`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and modify the admin contract.

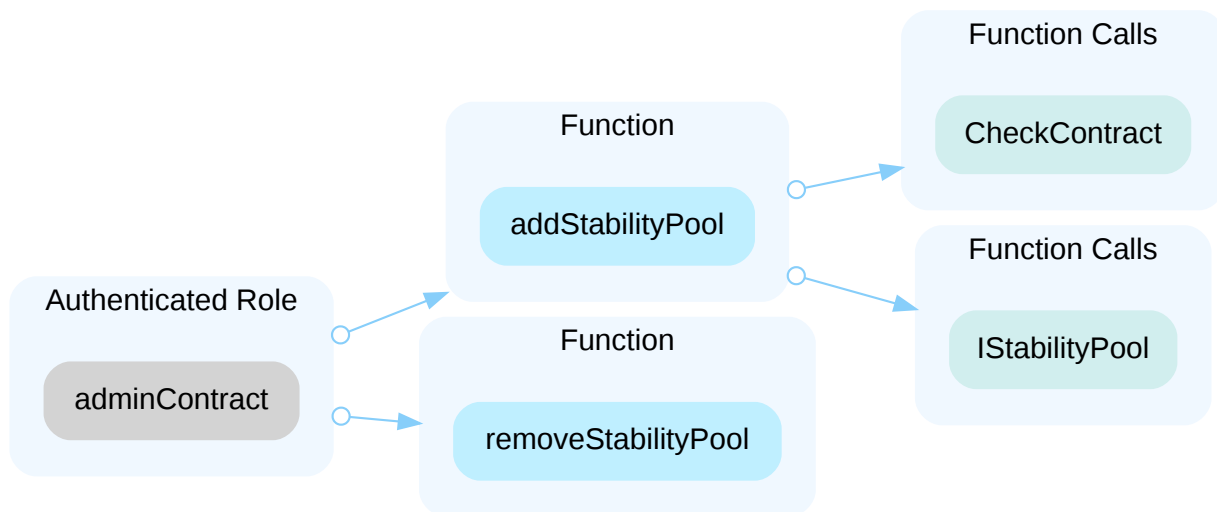

In the contract `PriceFeed`, the role `adminContract` has authority over the functions shown in the diagram below. Any compromise to the `adminContract` account may allow the hacker to take advantage of this authority and add Chainlink oracles.

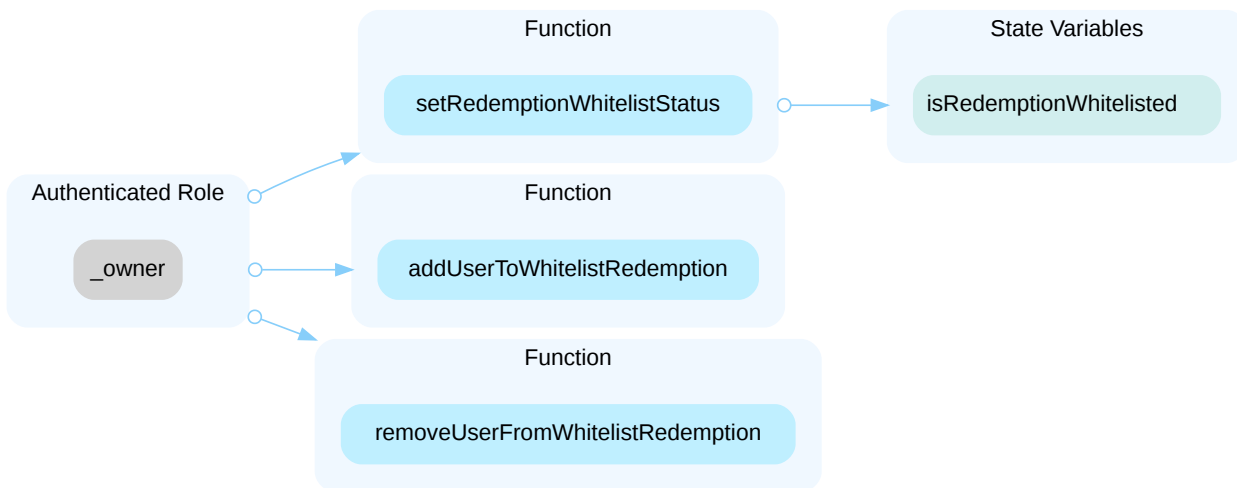

In the contract `StabilityPoolManager`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and modify the admin contract.

In the contract `StabilityPoolManager`, the role `adminContract` has authority over the functions shown in the diagram below. Any compromise to the `adminContract` account may allow the hacker to take advantage of this authority and add or remove stability pools.

In the contract `TroveManager`, the role `_owner` has authority over the functions shown in the diagram below. Any compromise to the `_owner` account may allow the hacker to take advantage of this authority and add or remove users from the `whitelistRedemption` array.

In addition, the contracts

- `ActivePool`,
- `AdminContract`,
- `BorrowerOperations`,
- `CollSurplusPool`,
- `DefaultPool`,
- `DfrancBase`,
- `DfrancParameters`,
- `HintHelpers`,

- PriceFeed ,
- SortedTrove ,
- StabilityPool ,
- StabilityPoolManager ,
- TroveManager ,
- TroveManagerHelpers ,
- CommunityIssuance ,
- LockedMON ,
- MONStaking ,
- PriceFeed ,
- SortedTrove ,
- StabilityPoolManager

are upgradeable contracts, meaning the owner can upgrade the contract without the community's consensus. If an attacker compromises the account, they can change the implementation of the contract and drain tokens from the contract.

Recommendation

The risk describes the current project design and potentially makes iterations to improve in the security operation and level of decentralization, which in most cases cannot be resolved entirely at the present stage. We advise the client to carefully manage the privileged account's private key to avoid any potential risks of being hacked. In general, we strongly recommend centralized privileges or roles in the protocol be improved via a decentralized mechanism or smart-contract-based accounts with enhanced security practices, e.g., multi-signature wallets.

Indicatively, here are some feasible suggestions that would also mitigate the potential risk at a different level in terms of short-term, long-term and permanent:

Short Term:

Timelock and Multi sign ($2/3$, $3/5$) combination *mitigate* by delaying the sensitive operation and avoiding a single point of key management failure.

- Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
AND
- Assignment of privileged roles to multi-signature wallets to prevent a single point of failure due to the private key compromised;
AND
- A medium/blog link for sharing the timelock contract and multi-signers addresses information with the public audience.

Long Term:

Timelock and DAO, the combination, *mitigate* by applying decentralization and transparency.

- Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
AND
- Introduction of a DAO/governance/voting module to increase transparency and user involvement;
AND
- A medium/blog link for sharing the timelock contract, multi-signers addresses, and DAO information with the public audience.

Permanent:

Renouncing the ownership or removing the function can be considered *fully resolved*.

- Renounce the ownership and never claim back the privileged roles;
OR
- Remove the risky functionality.

Noted: Recommend considering the long-term solution or the permanent solution. The project team shall make a decision based on the current state of their project, timeline, and project resources.

I Alleviation

[DeFi Franc] :

The team has implemented the following short term solution:

1. Multi-sign proxy address:
 - <https://etherscan.io/address/0x83737eae72ba7597b36494d723fbf58cafee8a69>
2. Transaction proof for transferring ownership to multi-signature proxy:
 - <https://etherscan.io/tx/0xea7d8303eb36885d2446bd3ea73ca64027f5e851c5ba0119fddd0370b3604468>
3. Internal multi-signature address:
 - <https://etherscan.io/address/0x8c013078c75e790Ffed8E11342EcfF53c5cd73A8>,
 - <https://etherscan.io/address/0x7AFF0f97357a7e8b577298f2fe81E6330975e28d>,
 - <https://etherscan.io/address/0x67733CFa01B42900057759a8EBA97AFED02C44E8>

GLOBAL-02 | LACK OF STORAGE GAP

Category	Severity	Location	Status
Language Specific	● Medium		● Resolved

Description

ActivePool, AdminContract, BorrowerOperations, CollSurplusPool, DefaultPool, DfrancBase, DfrancParameters, HintHelpers, PriceFeed, SortedTrove, StabilityPool, StabilityPoolManager, TroveManager, TroveManagerHelpers, CommunityIssuance, LockedMON, MONStaking, PriceFeed, SortedTrove, StabilityPoolManager are upgradeable contracts.

For upgradeable contracts, there must be a storage gap to "allow developers to freely add new state variables in the future without compromising the storage compatibility with existing deployments". Otherwise, it may be very difficult to write new implementation code. Without a storage gap, the variable in a child contract might be overwritten by the upgraded base contract if new variables are added to the base contract.

Refer to <https://docs.openzeppelin.com/upgrades-plugins/1.x/writing-upgradeable>

Recommendation

It is recommended to add an appropriate storage gap at the end of each upgradeable contract.

Alleviation

[DeFi Franc] :

The team resolved the finding in commit [d6f731b32d6b04aa65f987c330e2cdb108f28c54](#) by modifying the design and opting for non-upgradeable contracts.

CIM-01 | POTENTIAL INCORRECT ISSUANCE IN `issueMON()`

Logical Issue	● Minor	MON/CommunityIssuance.sol: 173~195	● Resolved

Description

The function `issueMON()` is called by the `StabilityPool` and returns the new MON issuance of the pool. The value of the new issuance is the multiplication of the number of minutes from the `lastUpdateTime[pool]` to the `block.timestamp`, and the `monDistributionsByPool[stabilityPool]`.

The variable `lastUpdateTime[pool]` will update to `block.timestamp` in every call, unless the total issuance has met the cap.

Due to the division truncation in solidity, the `timePassed` will be 0 if the interval is less than one minute and the `issuance` will also be 0.

```
uint256 timePassed = block.timestamp.sub(lastUpdateTime[stabilityPool]).div(
    SECONDS_IN_ONE_MINUTE
);
uint256 totalDistributedSinceBeginning =
monDistributionsByPool[stabilityPool].mul(
    timePassed
);
```

As a result, in the case of multiple calls where the interval between each call is less than one minute, the `issuance` returned is always 0 and the total issuance will not match the actual value.

Recommendation

The auditing team recommends updating `lastUpdateTime[_pool]` in terms of minutes instead of seconds.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in the commit hash [f14dc00a17d3ec14e493648913c23533732934f0](#).

CKP-01 | LACK OF CHECK ON `adminContract`

Category	Severity	Location	Status
Inconsistency	● Minor	DfrancParameters.sol: 76~79; MON/CommunityIssuance.sol: 83~86; P riceFeed.sol: 50~53; StabilityPoolManager.sol: 32~35	● Resolved

Description

In the aforementioned contracts, upon initialization (`setAddresses()`), `adminContract` is checked to ensure that the address corresponds to a contract.

This verification is performed with the `checkContract()` function.

However, the owner can later change the address for an EOA, because the `checkContract()` verification is missing in the `setAdminContract()` function.

```
22     function setAddresses(address _adminContract) external initializer {
23         require(!isInitialized, "Already initialized");
24         checkContract(_adminContract);
25         isInitialized = true;
26
27         __Ownable_init();
28
29         adminContract = _adminContract;
30     }
31
32     function setAdminContract(address _admin) external onlyOwner {
33         require(_admin != address(0), "Admin cannot be empty address");
34         adminContract = _admin;
35     }
```

Recommendation

It is recommended to add the `checkContract()` verification inside the `setAdminContract()` function.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in the commit hash [ae33c3a00044a91e8a8732d83639d27852fa8132](#).

CKP-02 | UNCHECKED ERC-20 `transfer()` / `transferFrom()` CALL

Category	Severity	Location	Status
Volatile Code	● Minor	MON/CommunityIssuance.sol: 225; MON/MONStaking.sol: 118, 138, 161, 182; Proxy/TokenScript.sol: 19, 35	● Resolved

Description

The return value of the `transfer()/transferFrom()` call is not checked.

```
225     monToken.transfer(_account, safeAmount);
```

```
118         dchfToken.transfer(msg.sender, DCHFGain);
```

```
138     monToken.transferFrom(msg.sender, address(this), _MONamount);
```

```
161         dchfToken.transfer(msg.sender, DCHFGain);
```

```
182     monToken.transfer(msg.sender, MONToWithdraw);
```

```
19     token.transfer(recipient, amount);
```

```
35     token.transferFrom(sender, recipient, amount);
```

Recommendation

Since some ERC-20 tokens return no values and others return a `bool` value, they should be handled with care. We advise using the [OpenZeppelin's SafeERC20.sol](#) implementation to interact with the `transfer()` and `transferFrom()` functions of external ERC-20 tokens. The OpenZeppelin implementation checks for the existence of a return value and reverts if `false` is returned, making it compatible with all ERC-20 token implementations.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in commit [f6af9db8addb65a8dc181b6241970242d8cc21f5](#).

DPK-01 | LACK OF INPUT VALIDATION

Category	Severity	Location	Status
Volatile Code	● Minor	DfrancParameters.sol: 149–150	● Partially Resolved

Description

The following functions lack input validation and could intentionally or unintentionally break the protocol.

- The functions `setMCR()` and `setCCR()` can change CCR and MCR, which could result in $CCR < MCR$.
- The functions `setBorrowingFeeFloor()` and `setMaxBorrowingFee()` can change `MAX_BORROWING_FEE` and `BORROWING_FEE_FLOOR`, which could result in $MAX_BORROWING_FEE < BORROWING_FEE_FLOOR$.
- The function `setDCHFGasCompensation()` can increase `DCHF_GAS_COMPENSATION` which could result in not having enough DCHF tokens to burn from the gas pool, preventing liquidations and redemptions.

Recommendation

Consider adding input verification such as `require` statements to check if the new value is consistent with the system protocol and does not cause an error for operations on existing troves. The following are some possible solutions.

- For the functions `setMCR()` and `setCCR()`, include `require(MCR[_asset] < CCR[_asset])` after the new value is set.
- For the functions `setBorrowingFeeFloor()` and `setMaxBorrowingFee()`, include `require(MAX_BORROWING_FEE[_asset] > BORROWING_FEE_FLOOR[_asset])`
- For the function `setDCHFGasCompensation()`, mint or burn to the gas pool whenever `DCHF_GAS_COMPENSATION` is changed to ensure enough tokens are available in the gas pool.

Alleviation

[DeFi Franc]

The team heeded the advice and partially resolved the finding in the commit hash

[3df6e56e38aa045c9abdad48a796b916b6f76edd](#) by adding checks on the borrowing fee and only allowing the first change of the gas compensation to be a decrease. However, it is still possible for the MCR of an asset to be above the CCR.

ERP-01 | SUSCEPTIBLE TO SIGNATURE MALLEABILITY

Category	Severity	Location	Status
Volatile Code	● Minor	Dependencies/ERC20Permit.sol: 99	● Acknowledged

Description

The signature malleability is possible within the Elliptic Curve cryptographic system. An Elliptic Curve is symmetric on the X-axis, meaning two points can exist with the same `x` value. In the `r`, `s` and `v` representation this permits us to carefully adjust `s` to produce a second valid signature for the same `r`, thus breaking the assumption that a signature cannot be replayed in what is known as a replay-attack.

Recommendation

We advise to utilize a `recover(.)` function similar to that of the `ECDSA.sol` implementation of OpenZeppelin.

Alleviation

[DeFi Franc] :

The team acknowledged the advice and will not change the current codebase.

HHC-01 | POTENTIAL UNDERFLOW REVERT IN getRedemptionHints()

Category	Severity	Location	Status
Logical Issue	● Minor	HintHelpers.sol: 118	● Acknowledged

Description

According to the following code, the variable `_maxIterations` is used as an iteration condition for the while loop and is self-subtracting after each iteration.

```
if (_maxIterations == 0) {
    _maxIterations = type(uint256).max;
}

while (currentTroveuser != address(0) && remainingDCHF > 0 &&
_maxIterations-- > 0) {
    ...
}
```

If in the loop, the variable `_maxIterations` reaches 1 and the loop has not stopped, the variable `_maxIterations` (1) will be compared to 0 and subtracted. In the next iteration, the `_maxIterations` is 0 and the iteration is false. However, the operation `--` will be done and it will trigger an underflow revert, since the compiler version is `^0.8.14`.

Recommendation

The auditing team recommends placing the `--` operation within the while loop.

Alleviation

[DeFi Franc]

The team acknowledged the finding and decided to keep the codebase unchanged.

LMO-01 | DIVIDE BEFORE MULTIPLY

Category	Severity	Location	Status
Mathematical Operations	● Minor	MON/LockedMON.sol: 157~161	● Resolved

| Description

Performing integer division before multiplication truncates the lower bits, losing the precision of calculation.

```
157         claimable = entityRule
158             .totalSupply
159             .div(ONE_YEAR)
160             .mul(block.timestamp.sub(entityRule.createdDate))
161             .sub(entityRule.claimed);
```

| Recommendation

Apply multiplication before division to avoid loss of precision.

| Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in the commit hash [9eff3050bd1021fd1896d66e6d6fe43931628557](#).

MOC-01 | POTENTIAL REENTRANCY ATTACK (INCREMENTING STATE)

Category	Severity	Location	Status
Volatile Code	● Minor	MON/LockedMON.sol: 103, 104, 111, 137; MON/MONStaking.sol: 245, 246, 304, 307	● Resolved

Description

A reentrancy attack can occur when the contract creates a function that makes an external call to another untrusted contract before resolving any effects. If the attacker can control the untrusted contract, they can make a recursive call back to the original function, repeating interactions that would have otherwise not run after the external call resolved the effects.

This finding is considered minor because the state variable is only incremented or decremented. So, the effect of out-of-order increments may be unobservable after transaction. However, the reentrancy vulnerability may still cause other issues in the middle of transaction.

External call(s)

```
103     sendMONTokenToEntity(_entity);
```

- This function call executes the following external call(s).
- In `SafeERC20._callOptionalReturn` ,
 - `returndata = address(token).functionCall(data, SafeERC20: low-level call failed)`
- In `Address.functionCallWithValue` ,
 - `(success, returndata) = target.call{value: value}(data)`
- In `LockedMON.sendMONTokenToEntity` ,
 - `monToken.safeTransfer(_entity, unclaimedAmount)`

State variables written after the call(s)

```
104     Rule storage vestingRule = entitiesVesting[_entity];
```

```
111     vestingRule.totalSupply = newTotalSupply;
```

External call(s)

```
245     _sendAsset(treasury, _asset, _amount);
```

- This function call executes the following external call(s).
- In `SafeERC20Upgradeable._callOptionalReturn`,
 - `returndata = address(token).functionCall(data, SafeERC20: low-level call failed)`
- In `MONStaking._sendAsset`,
 - `(success) = _sendTo.call{value: _amount}()`
- In `AddressUpgradeable.functionCallWithValue`,
 - `(success, returndata) = target.call{value: value}(data)`
- In `MONStaking._sendAsset`,
 - `IERC20Upgradeable(_asset).safeTransfer(_sendTo, _amount)`

State variables written after the call(s)

```
246     sentToTreasuryTracker[_asset] += _amount;
```

Recommendation

We recommend using the [Checks-Effects-Interactions Pattern](#) to avoid the risk of calling unknown contracts or applying OpenZeppelin [ReentrancyGuard](#) library - `nonReentrant` modifier for the aforementioned functions to prevent reentrancy attack.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by adding the `nonReentrant` modifier, in the commit [e3492f4df18d711fd8962cbeedf4371f645ec92](#).

MOC-02 | CHECK EFFECT INTERACTION PATTERN VIOLATED

Category	Severity	Location	Status
Volatile Code	● Minor	MON/LockedMON.sol: 115, 118~120, 122, 137; MON/MONStaking.sol: 118, 123, 127, 161, 165, 287, 288, 304, 307	● Resolved

Description

A reentrancy attack can occur when the contract creates a function that makes an external call to another untrusted contract before resolving any effects. If the attacker can control the untrusted contract, they can make a recursive call back to the original function, repeating interactions that would have otherwise not run after the external call resolved the effects.

External call(s)

```
115     sendMONTokenToEntity(_entity);
```

- This function call executes the following external call(s).
- In `SafeERC20._callOptionalReturn`,
 - `returndata = address(token).functionCall(data, SafeERC20: low-level call failed)`
- In `Address.functionCallWithValue`,
 - `(success, returndata) = target.call{value: value}(data)`
- In `LockedMON.sendMONTokenToEntity`,
 - `monToken.safeTransfer(_entity, unclaimedAmount)`

State variables written after the call(s)

```
118     assignedMONTokens = assignedMONTokens.sub(  
119         vestingRule.totalSupply.sub(vestingRule.claimed)  
120     );
```

```
122     delete entitiesVesting[_entity];
```

External call(s)

```
118 dchfToken.transfer(msg.sender, DCHFGain);
```

```
123 _sendAssetGainToUser(asset, AssetGain);
```

- This function call executes the following external call(s).
- In `SafeERC20Upgradeable._callOptionalReturn` ,
 - `returndata = address(token).functionCall(data, SafeERC20: low-level call failed)`
- In `MONStaking._sendAsset` ,
 - `(success) = _sendTo.call{value: _amount}()`
- In `AddressUpgradeable.functionCallWithValue` ,
 - `(success, returndata) = target.call{value: value}(data)`
- In `MONStaking._sendAsset` ,
 - `IERC20Upgradeable(_asset).safeTransfer(_sendTo, _amount)`

State variables written after the call(s)

```
127 _updateUserSnapshots(asset, msg.sender);
```

- This function call executes the following assignment(s).
- In `MONStaking._updateUserSnapshots` ,
 - `snapshots[_user].F_ASSET_Snapshot[_asset] = F_ASSETS[_asset]`
- In `MONStaking._updateUserSnapshots` ,
 - `snapshots[_user].F_DCHF_Snapshot = F_DCHF`

External call(s)

```
161 dchfToken.transfer(msg.sender, DCHFGain);
```

State variables written after the call(s)

```
165 _updateUserSnapshots(asset, msg.sender);
```

- This function call executes the following assignment(s).
- In `MONStaking._updateUserSnapshots` ,
 - `snapshots[_user].F_ASSET_Snapshot[_asset] = F_ASSETS[_asset]`
- In `MONStaking._updateUserSnapshots` ,
 - `snapshots[_user].F_DCHF_Snapshot = F_DCHF`

Recommendation

We recommend using the [Checks-Effects-Interactions Pattern](#) to avoid the risk of calling unknown contracts or applying OpenZeppelin [ReentrancyGuard](#) library - `nonReentrant` modifier for the aforementioned functions to prevent reentrancy attack.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by adding the `nonReentrant` modifier, in the commit [e3492f4df18d711fd8962cbeefdf4371f645ec92](#).

MOT-01 | INITIAL TOKEN DISTRIBUTION

Category	Severity	Location	Status
Centralization / Privilege	● Major	MON/MONTToken.sol: 20-22	● Mitigated

I Description

All of the `MON` tokens are sent to the `_treasurySig` address when deploying the contract. This could be a centralization risk as this address can distribute MON tokens without obtaining the consensus of the community.

I Recommendation

We recommend the team to be transparent regarding the initial token distribution process, and the team shall make enough efforts to restrict the access of the private key.

I Alleviation

[DeFi Franc] :

The team published a [Tokenomics document](#) describing how the MON tokens will be distributed.

STC-01 | INCORRECT INPUT USED

Category	Severity	Location	Status
Volatile Code	● Medium	SortedTrove.sol: 96~97	● Resolved

Description

The `troveManagerHelpers` is an interface variable for the interface `ITroveManagerHelpers`. The interface is using `_troveManagerAddress` instead of `_troveManagerHelpersAddress`.

```
96     troveManagerHelpers = ITroveManagerHelpers(_troveManagerAddress);
```

Any function that calls or checks using `troveManagerHelpers` will most likely result in a failure.

Recommendation

Change `_troveManagerAddress` to `_troveManagerHelpersAddress`.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by changing the input, in the commit [ca4d9ec85e38429fa484d6bb40dc7ffc9770256a](https://github.com/Defi-Franc/SortedTrove/commit/ca4d9ec85e38429fa484d6bb40dc7ffc9770256a).

STC-02 | LACK OF INPUT VALIDATION

Category	Severity	Location	Status
Inconsistency	● Minor	SortedTrove.sol: 83-84	● Resolved

Description

The input parameter `_troveManagerHelpersAddress` is missing input validation. Despite `_troveManagerAddress` and `_borrowerOperationsAddress` being checked if they are contracts via the function `checkContract`, this check is not performed on `_troveManagerHelpersAddress`. Lack of input validation can result in assigning an incorrect address or zero address.

Recommendation

Consider adding `checkContract(_troveManagerHelpersAddress)` to check if `_troveManagerHelpersAddress` is not the zero address and also a contract.

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [616f2a84a7a7a7bfdd2f042b84ffbd147dd1067b](#).

STD-01 | INCOMPATIBLE WITH TOKENS WITH MORE THAN 18 DECIMALS

Category	Severity	Location	Status
Control Flow	● Minor	Dependencies/SafetyTransfer.sol: 8~9	● Resolved

Description

Although uncommon, there are tokens that have more than 18 decimals such as the `YAMV2` token, which has 24 decimals. The current implementation does not have any control flow that takes decimals greater than 18 into consideration.

Recommendation

Carefully check the decimal of assets added to the protocol in the future, or include the following code to handle assets that have more than 18 decimals:

```
19         } else {  
20             return _amount.mul(10**(decimals - 18))  
21         }
```

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in the commit [65fd7d4fb22638ff87db63cfaccb45fb18e293e6](#).

TMC-01 | UNCALLABLE FUNCTION IN TroveManager

Category	Severity	Location	Status
Volatile Code	● Medium	TroveManager.sol: 980-981	● Resolved

Description

Line 980 makes an external call to the function `troveManagerHelpers.updateStakeAndTotalStakes()`. However, it is uncallable since the modifier for `updateStakeAndTotalStakes()` is `onlyBorrowerOperations` which limits the caller to the `BorrowerOperations` contract and does not include the `TroveManager` contract.

Recommendation

Change the modifier `onlyBorrowerOperations` to `onlyB0orTM`. If the suggested change is made, also consider removing the function `updateStakeAndTotalStakesTrove` in `TroveManagerHelpers` contract since the functionality will overlap with `updateStakeAndTotalStakes`.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by changing the modifier in the commit [a38c2c749fe3925a0e1c218c8bed22a3ebb3f041](https://github.com/DeFi-Franc/DeFi-Franc/commit/a38c2c749fe3925a0e1c218c8bed22a3ebb3f041).

TMH-01 | INCORRECT MODIFIER

Category	Severity	Location	Status
Inconsistency	● Medium	TroveManagerHelpers.sol: 896-897	● Resolved

Description

The comment on line 888 states: `Trove property setters, called by TroveManager`. This comment suggests that the function that follows will be called by the contract `TroveManager`.

```
888 // --- Trove property setters, called by TroveManager ---
889
890 // todo: only Trovemanager
891 function setTroveDeptAndColl(
892     address _asset,
893     address _borrower,
894     uint256 _debt,
895     uint256 _coll
896 ) external override onlyBorrowerOperations {
```

However, the function that follows is `setTroveDeptAndColl()` and has the modifier `onlyBorrowerOperations`. Furthermore, the contract `BorrowerOperations` does not contain any calls to the function `setTroveDeptAndColl()`. Instead, the contract `TroveManager` calls the function `setTroveDeptAndColl()`.

If `borrowerOperationsAddress` is properly set to the contract `BorrowerOperations`, this function will not be callable and subsequently, the redemption of collateral will not be possible since the function `redeemCollateral()` in the contract `TroveManager` calls this function.

Recommendation

Change the modifier from `_onlyBorrowerOperations` to `onlyTroveManager`.

Alleviation

[DeFi Franc]:

The team heeded the advice and resolved this issue by changing the modifier, in the commit [4903708fcf4e59eaa82c191728ca2d1d8bacdb44](#).

TMH-02 | UNCALLABLE FUNCTIONS IN TroveManagerHelpers

Category	Severity	Location	Status
Volatile Code	● Medium	TroveManagerHelpers.sol: 471~472, 473~474, 971~972	● Resolved

Description

The following lines of code in the contract `TroveManagerHelpers` are uncallable due to the modifier of the external callee function.

- Line 471 is assumed to make an external call to the function `decreaseDCHFDebt()` of the `ActivePool` contract. However the function `decreaseDCHFDebt()` has a modifier `callerIsB0orTroveMorSP` which requires the caller to be `BorrowerOperations`, `TroveManager`, or `StabilityPool` contract.
- Line 473 is assumed to make an external call to the function `sendAsset` of the `ActivePool` contract. However the function `sendAsset` has a modifier `callerIsB0orTroveMorSP` which requires the caller to be `BorrowerOperations`, `TroveManager`, or `StabilityPool` contract.
- Line 971 is assumed to make an external call to the function `increaseDCHFDebt` of the `ActivePool` contract. However the function `increaseDCHFDebt` has a modifier `callerIsB0orTroveM` which requires the caller to be `BorrowerOperations` or `TroveManager` contract.

Since `TroveManagerHelpers` is not included in any of the modifiers of the callee function, it prevents the `TroveManagerHelpers` contract from calling these functions.

Recommendation

Check if the call to the external functions are correct and if it is, include the `TroveManagerHelpers` in the modifier `callerIsB0orTroveMorSP` and `callerIsB0orTroveM` of the `ActivePool` contract, to allow calls to the function from the `TroveManagerHelpers` contract.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by adding `troveManagerHelpersAddress` in the `callerIsB0orTroveMorSP` modifier, in the commit [cc00b0ecb22f7b435bbef88f14ed4645db4c972d](https://github.com/DefiFranc/DefiFranc/commit/cc00b0ecb22f7b435bbef88f14ed4645db4c972d).

TMH-03 | LACK OF INPUT VALIDATION

Category	Severity	Location	Status
Inconsistency	● Minor	TroveManagerHelpers.sol: 119~120	● Resolved

Description

The input `_troveManagerAddress` does not have any input validation. Other input parameters are passed into the function `checkContract()` which checks if the address is not the zero address and if the address contains code. Multiple functions have the `onlyTroveManager` modifier which requires the caller to be a `troveManager` contract and these functions will not be callable if the address is incorrectly set.

Recommendation

Consider adding `checkContract(_troveManagerAddress)` to prevent incorrectly setting `troveManager` as a zero address or to an EOA.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved the finding in the commit [ca4d9ec85e38429fa484d6bb40dc7fc9770256a](#).

CKP-07 | MISSING ZERO ADDRESS VALIDATION

Category	Severity	Location	Status
Volatile Code	● Informational	MON/MONStaking.sol: 197; Proxy/ETHTransferScript.sol: 7	● Resolved

Description

Addresses should be checked before assignment or external call to make sure they are not zero addresses.

```
197     treasury = _treasury;
```

- `_treasury` is not zero-checked before being used.

```
7     (bool success, ) = _recipient.call{ value: _amount }("");
```

- `_recipient` is not zero-checked before being used.

Recommendation

Add a zero-check for the passed-in address value to prevent unexpected errors.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by adding the Zero address verification in the `MONStaking` contract, and by deleting the `ETHTransferScript` contract, in the commit [f74e188e42b3e71e51f25f10fafef276a92c6fd4](https://github.com/DeFi-Franc/DeFi-Franc/commit/f74e188e42b3e71e51f25f10fafef276a92c6fd4).

TMH-04 | REPETITIVE FUNCTION IMPLEMENTATION

Category	Severity	Location	Status
Coding Style	● Informational	TroveManagerHelpers.sol: 349–350, 373–374	● Resolved

Description

The following functions in `TroveManagerHelpers` have different function names but have the same logic implemented.

- Both the functions `removeStake()` and `removeStakeTrove()` call the internal function `_removeStake()` with the only difference being the modifier.
- Both the functions `updateStakeAndTotalStakes()` and `updateStakeAndTotalStakesTrove()` call the internal function `_updateStakeAndTotalStakes()` with the only difference being the modifier.

The modifier for the functions `removeStake` and `updateStakeAndTotalStakes` is `onlyB0orTM`, while the modifier for the functions `removeStakeTrove` and `updateStakeAndTotalStakesTrove` is `onlyTroveManager`.

Since the `TroveManager` contract can call the function with either modifier and the effect has no difference, `removeStakeTrove` and `updateStakeAndTotalStakesTrove` can be removed.

Recommendation

Consider removing the functions `removeStakeTrove()` and `updateStakeAndTotalStakesTrove()`. Furthermore, change any calls to the function `removeStakeTrove()` to the function `removeStake()` and calls to the function `updateStakeAndTotalStakesTrove()` to `updateStakeAndTotalStakes()`. This will improve the maintainability and readability of the code.

Alleviation

[DeFi Franc]:

The team heeded the advice and resolved this issue in the commit [80c9ec708ee778e24e71d49daaf937692178727e](#).

OPTIMIZATIONS | DEFI FRANC

ID	Title	Category	Severity	Status
<u>GLOBAL-03</u>	Unnecessary Use Of SafeMath And SafeMathUpgradeable	Gas Optimization	Optimization	● Acknowledged
<u>BOC-01</u>	Useless Statement	Logical Issue	Optimization	● Resolved
<u>CKP-03</u>	Improper Usage Of <code>public</code> And <code>external</code> Type	Gas Optimization	Optimization	● Resolved
<u>DMD-01</u>	Unnecessary Write To Memory	Gas Optimization	Optimization	● Resolved
<u>LMO-02</u>	Costly Operation Inside Loop	Gas Optimization	Optimization	● Resolved
<u>MOT-02</u>	State Variable Should Be Declared Constant	Gas Optimization	Optimization	● Resolved
<u>TMC-02</u>	Unnecessary External Call	Gas Optimization	Optimization	● Resolved

GLOBAL-03 | UNNECESSARY USE OF SAFEMATH AND SAFEMATHUPGRADEABLE

Category	Severity	Location	Status
Gas Optimization	● Optimization		● Acknowledged

Description

The `SafeMath` and `SafeMathUpgradeable` library is used unnecessarily throughout the codebase. With Solidity compiler versions 0.8.0 or newer, arithmetic operations will automatically revert in case of integer overflow or underflow.

Recommendation

We advise removing the usage of `SafeMath` and `SafeMathUpgradeable` library and using the built-in arithmetic operations provided by the Solidity programming language for gas optimization and code clarity.

Alleviation

[DeFi Franc]

The team acknowledged the finding and decided to keep the codebase unchanged.

BOC-01 | USELESS STATEMENT

Category	Severity	Location	Status
Logical Issue	● Optimization	BorrowerOperations.sol: 191	● Resolved

Description

In the `openTrove()` function of the `BorrowerOperations` contract, a line is present while performing no action.

```
191     vars.DCHFFee;
```

Recommendation

It is recommended to remove this line if it is not necessary.

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [fe05bb58171d5e4195c82ec4ed82ca6beb5392e4](#).

CKP-03 | IMPROPER USAGE OF `public` AND `external` TYPE

Category	Severity	Location	Status
Gas Optimization	● Optimization	DCHFToken.sol: 106, 111; Dependencies/ERC20Permit.sol: 82; DfrancParameters.sol: 126; MON/LockedMON.sol: 40, 80, 98, 114; MON/MONStaking.sol: 196; Migrations.sol: 17, 21; TroveManagerHelpers.sol: 782	● Resolved

Description

`public` functions that are never called by the contract could be declared as `external`. `external` functions are more efficient than `public` functions.

Recommendation

Consider using the `external` attribute for public functions that are never called within the contract.

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [f8f67806778ac36578d9fea42abc0fbb881694a8](#).

DMD-01 | UNNECESSARY WRITE TO MEMORY

Category	Severity	Location	Status
Gas Optimization	● Optimization	Dependencies/DfrancMath.sol: 113~114	● Resolved

Description

The collateral ratio is first stored in a memory variable `newCollRatio`. Since the variable is not used and the function name conveys what the value returned is, the calculation can be returned directly. This will save the gas consumed from writing and reading to memory.

Recommendation

Consider removing line 111 and changing line 113 to:

```
113         return _coll.mul(_price).div(_debt);
```

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [8865e45b98fd6f54e3890e60b1361d73668b1dba](#).

LMO-02 | COSTLY OPERATION INSIDE LOOP

Category	Severity	Location	Status
Gas Optimization	● Optimization	MON/LockedMON.sol: 64	● Resolved

Description

Accessing storage variables in a loop can be costly in terms of gas consumption.

```
64         assignedMONTokens += _totalSupply;
```

Recommendation

We recommend using a local variable to hold the intermediate result.

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [3ec2be6920b68412bf7b22c8174f58462a959483](#).

MOT-02 | STATE VARIABLE SHOULD BE DECLARED CONSTANT

Category	Severity	Location	Status
Gas Optimization	● Optimization	MON/MONTToken.sol: 12	● Resolved

Description

State variables that never change should be declared as `constant` to save gas.

```
12     uint256 internal _1_MILLION = 1e24; // 1e6 * 1e18 = 1e24
```

- `_1_MILLION` should be declared `constant`.

Recommendation

We recommend adding the `constant` attribute to state variables that never change.

Alleviation

[DeFi Franc] :

The team heeded the advice and resolved this issue by putting the variable as constant, in the commit [c5463c14597b0bccf22dc49ced8fb00c2c9aafd6](#).

TMC-02 | UNNECESSARY EXTERNAL CALL

Category	Severity	Location	Status
Gas Optimization	● Optimization	TroveManager.sol: 648-649	● Resolved

Description

The function `troveManagerHelpers.checkRecoveryMode()` will make an external call to the contract `troveManagerHelpers` and ultimately invoke the internal function `_checkRecoveryMode`. However, `_checkRecoveryMode` is implemented in `DfrancBase.sol`, which is also a base contract for the contract `troveManager`. Since `_checkRecoveryMode` can be called internally, the external call to `troveManagerHelpers` is unnecessary.

Recommendation

Consider changing the code on line 648 to the following:

```
648     vars.recoveryModeAtStart = _checkRecoveryMode(_asset, vars.price);
```

Using internal calls will reduce gas costs compared to making external calls.

Alleviation

[DeFi Franc]

The team heeded the advice and resolved the finding in the commit hash [f4e31a2e04150257f1a87a78d106a0ce10b957e4](#).

APPENDIX | DEFI FRANC

Finding Categories

Categories	Description
Centralization / Privilege	Centralization / Privilege findings refer to either feature logic or implementation of components that act against the nature of decentralization, such as explicit ownership or specialized access roles in combination with a mechanism to relocate funds.
Gas Optimization	Gas Optimization findings do not affect the functionality of the code but generate different, more optimal EVM opcodes resulting in a reduction on the total gas cost of a transaction.
Mathematical Operations	Mathematical Operation findings relate to mishandling of math formulas, such as overflows, incorrect operations etc.
Logical Issue	Logical Issue findings detail a fault in the logic of the linked code, such as an incorrect notion on how block.timestamp works.
Control Flow	Control Flow findings concern the access control imposed on functions, such as owner-only functions being invoke-able by anyone under certain circumstances.
Volatile Code	Volatile Code findings refer to segments of code that behave unexpectedly on certain edge cases that may result in a vulnerability.
Language Specific	Language Specific findings are issues that would only arise within Solidity, i.e. incorrect usage of private or delete.
Coding Style	Coding Style findings usually do not affect the generated byte-code but rather comment on how to make the codebase more legible and, as a result, easily maintainable.
Inconsistency	Inconsistency findings refer to functions that should seemingly behave similarly yet contain different code, such as a constructor assignment imposing different require statements on the input variables than a setter function.

Checksum Calculation Method

The "Checksum" field in the "Audit Scope" section is calculated as the SHA-256 (Secure Hash Algorithm 2 with digest size of 256 bits) digest of the content of each file hosted in the listed source repository under the specified commit.

The result is hexadecimal encoded and is the same as the output of the Linux "sha256sum" command against the target file.

DISCLAIMER | CERTIK

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to you ("Customer" or the "Company") in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes, nor may copies be delivered to any other person other than the Company, without CertiK's prior written consent in each instance.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts CertiK to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. CertiK's position is that each company and individual are responsible for their own due diligence and continuous security. CertiK's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

The assessment services provided by CertiK is subject to dependencies and under continuing development. You agree that your access and/or use, including but not limited to any services, reports, and materials, will be at your sole risk on an as-is, where-is, and as-available basis. Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives, false negatives, and other unpredictable results. The services may access, and depend upon, multiple layers of third-parties.

ALL SERVICES, THE LABELS, THE ASSESSMENT REPORT, WORK PRODUCT, OR OTHER MATERIALS, OR ANY PRODUCTS OR RESULTS OF THE USE THEREOF ARE PROVIDED "AS IS" AND "AS AVAILABLE" AND WITH ALL FAULTS AND DEFECTS WITHOUT WARRANTY OF ANY KIND. CertiK | Securing the Web3 World

Founded in 2017 by leading academics in the field of Computer Science from both Yale and Columbia University, CertiK is a leading blockchain security company that serves to verify the security and correctness of smart contracts and blockchain-based protocols. Through the utilization of our world-class technical expertise, alongside our proprietary, innovative tech, we're able to support the success of our clients with best-in-class security, all whilst realizing our overarching vision; provable trust for all throughout all facets of blockchain.
